Precool/heat

Something weird I noticed: When the PMCC faults, I reset it by pressing and holding the power button for 20 seconds. When it powers back up, I check the charge history and it looks like the charger thinks it had a 44 min charge session after the timer ended and the car was charged, but before it faulted. In this case, the fault occurred 44 min after the charge was successful and it looks like during that time the charger thought it was charging even though the timer had ended and even though it did not use any power.
