PORSCHE TAYCAN

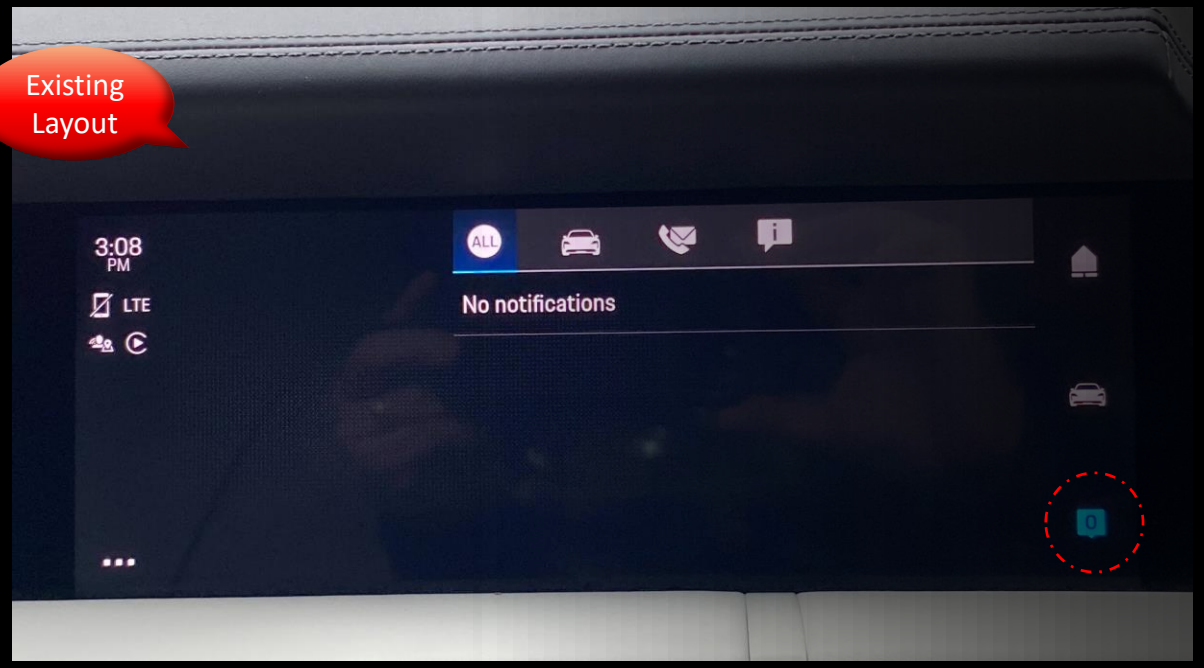
9 User Interface improvements *

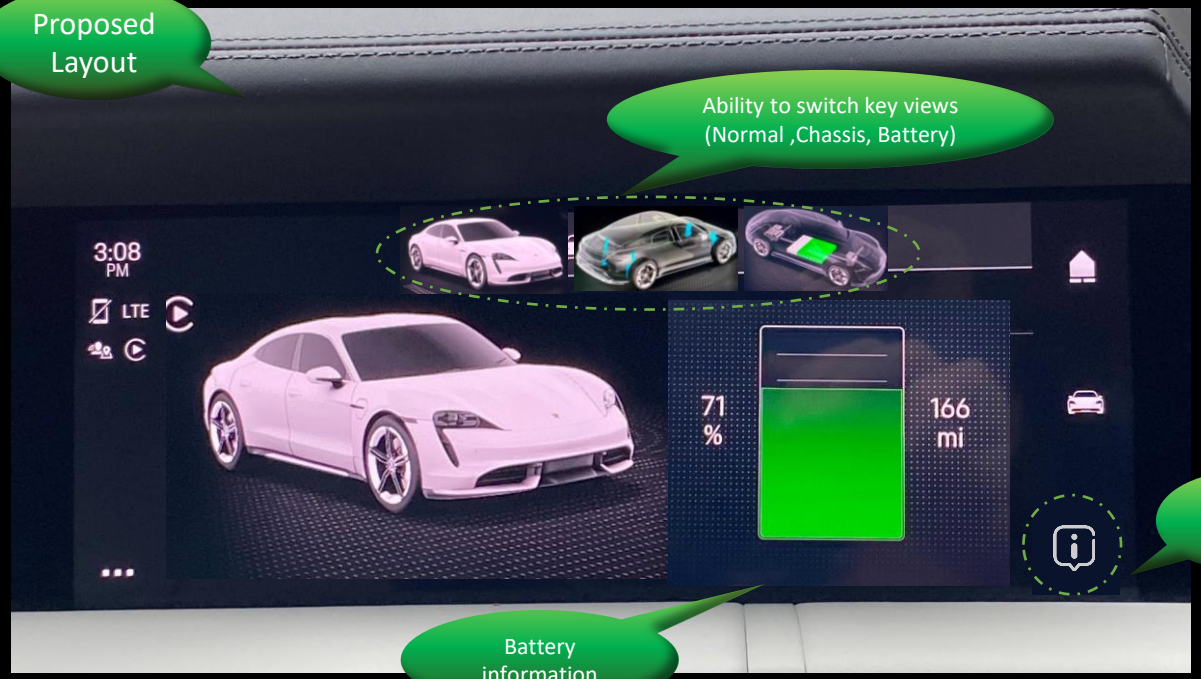
*(All at Zero cost)

1.) Keep the settings when car powered off.

Electric sports sounds is a chargeable option at £354/$500 but must be enabled every time the car is powered on

Suggestion : store the user setting to save the driver having to navigate a number of menus and avoid having to store this on the programmable button for pressing each time the Taycan is started.





2.) Remove Notification from main panel navigation

Notifications are rarely used by most drivers and when you click the item it shows a blank ‘no notifications screen’. This ties up prime dashboard ‘real estate’

Suggestion : replace notification icon with with a ‘car info’ button and show most pertinent information such as battery info and allow Taycan image to be clicked to switch between full view, chassis view, suspension view etc

3.) Programmable Steering Wheel Button

Suggestion : You can program this button including setting to previous or next track but suggestion is to allow one click and two click actions

e.g. one click next track, two clicks for previous track

4.) Allow next track from steering wheel button.

If the right dashboard ‘circle’ is on music then the steering wheel button indicated currently does nothing.

Proposal is that this button can be configured to skip to next music track.

5.) Main Screen 3rd row of icons

Suggestion : The third row of icons is difficult to navigate to as it requires scrolling whilst driving.

Much better to have two rows with more icons per row than three rows

6.) Maps in powermode

Suggestion:

Allow maps to be shown as an option in right instrument cluster dial.

This allows power meter to be displayed and map at the same time

7.) Replace Innodrive Audi Car

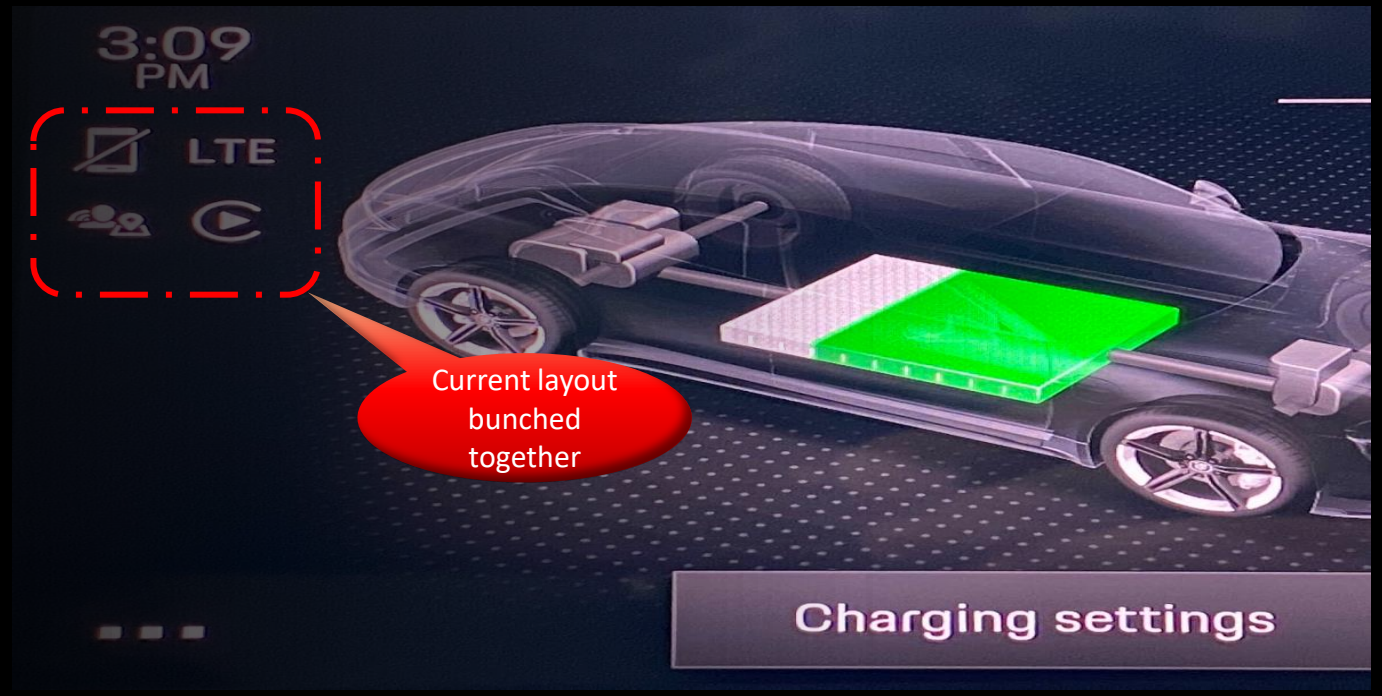
Suggestion:

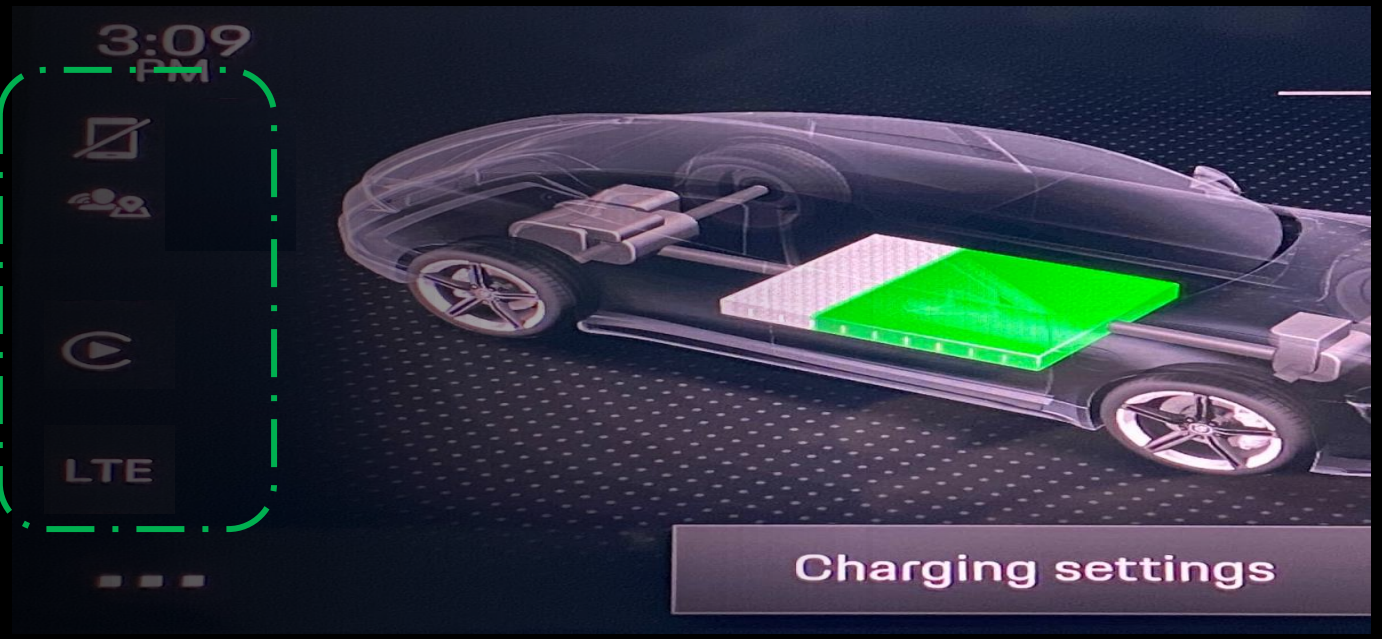
Replace Audi car icon in innodrive with classic Porsche icon ☺

8.) Left hand side navigation

Left side icons are difficult to use whilst driving as far away from driver and very small.

Suggestion : change icon size and make vertical rather than grouped together

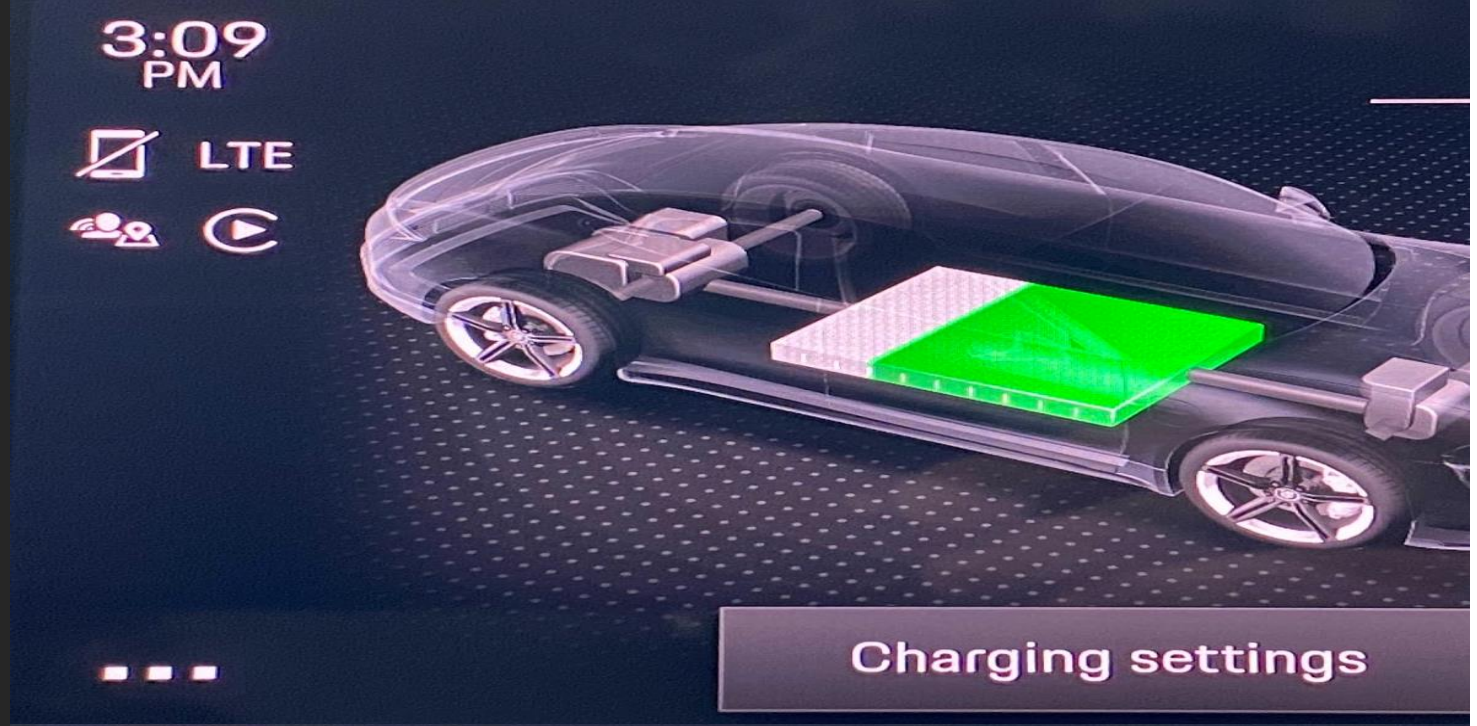


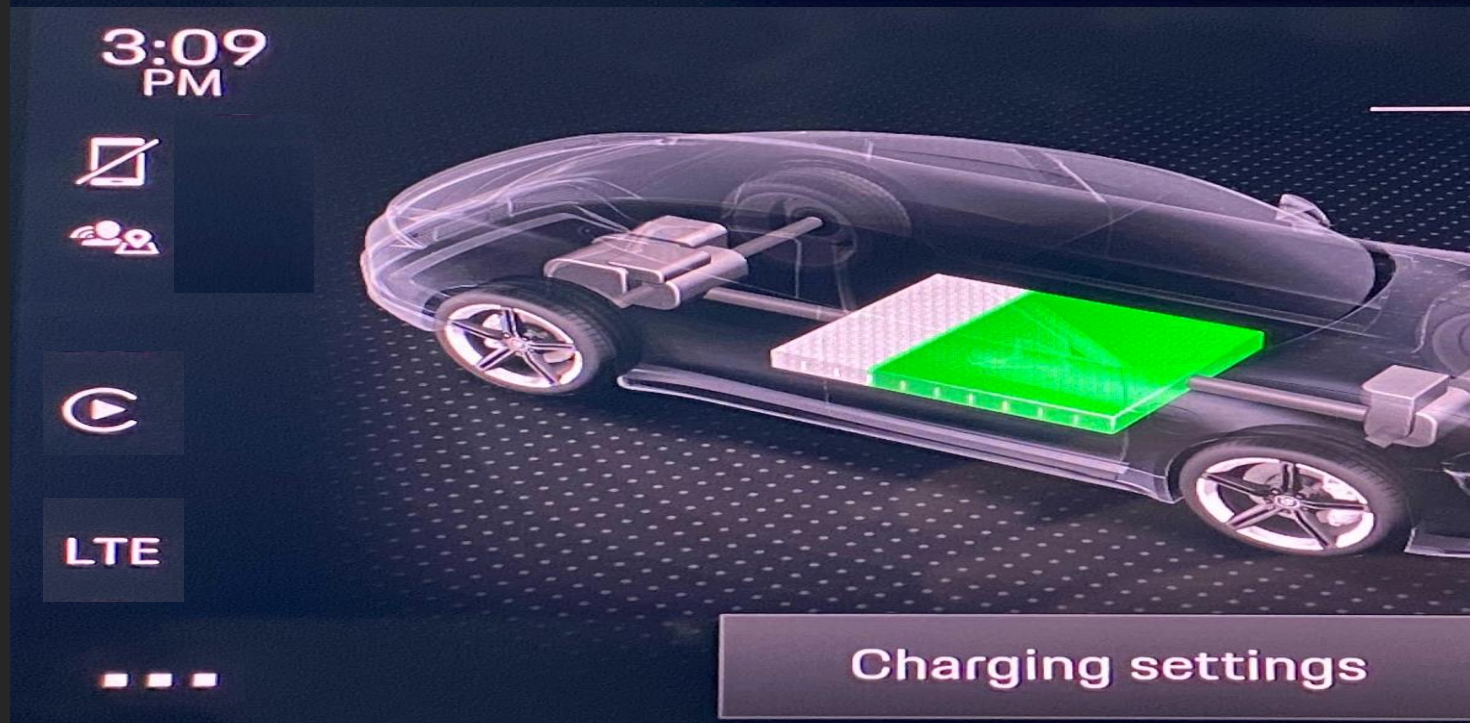


8.) Left side Icons

Left side icons are difficult to use whilst driving as far away from driver and very small.

Suggestion : Spread further diown





9.) Fix UI Bugs

Suggestion:

The chassis view is sometimes shown behind the menu text on the right-hand side when the car is powered on rather than the correct location of the left-side so it overlaps the menu text
